As a casual gym goer, I would like a way to list all my exercises. It should be quick and easily sorted according to the type of exercise. Aside from this, I should also be able to add details like weight, sets, and status.

Exercise List 🏋️

All ⌄

Activity: [_____] Add

Bench Press
Weight: 200 Sets: 5

Done | Edit | Delete

Lateral Pull Downs
Weight: 20 Sets: 4

Done | Edit | Delete

Leg Press
Weight: 300 Sets: 3

Done | Edit | Delete

Shoulder Press
Weight: __ Sets: __

Done | Edit | Delete
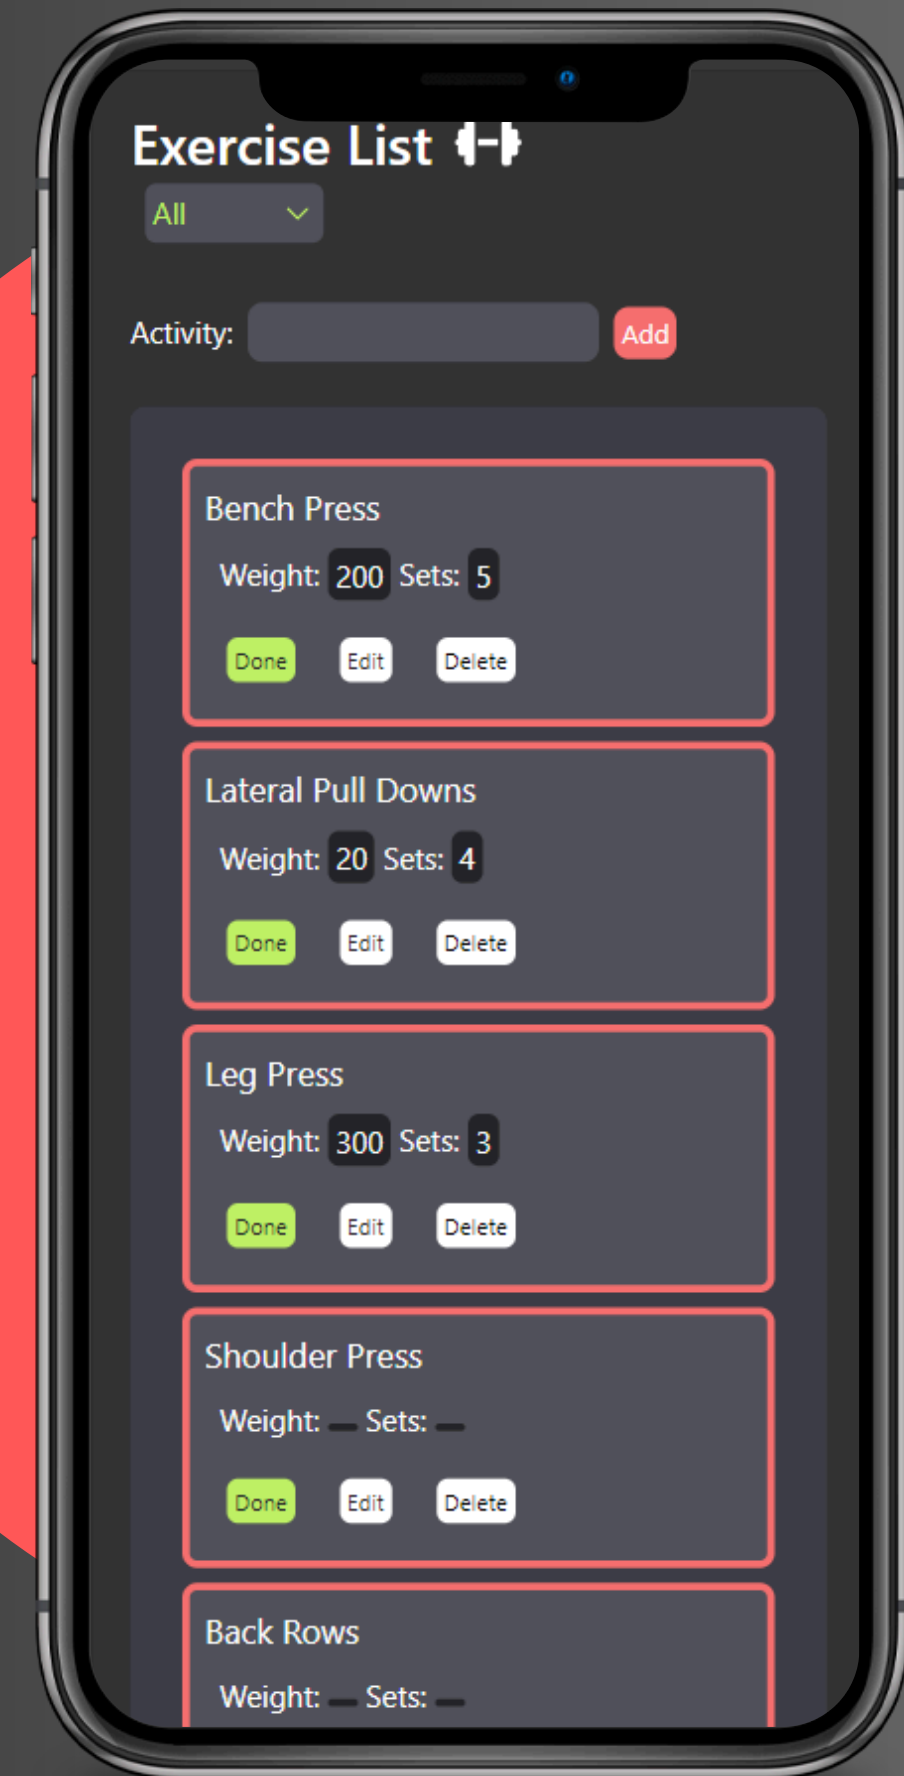

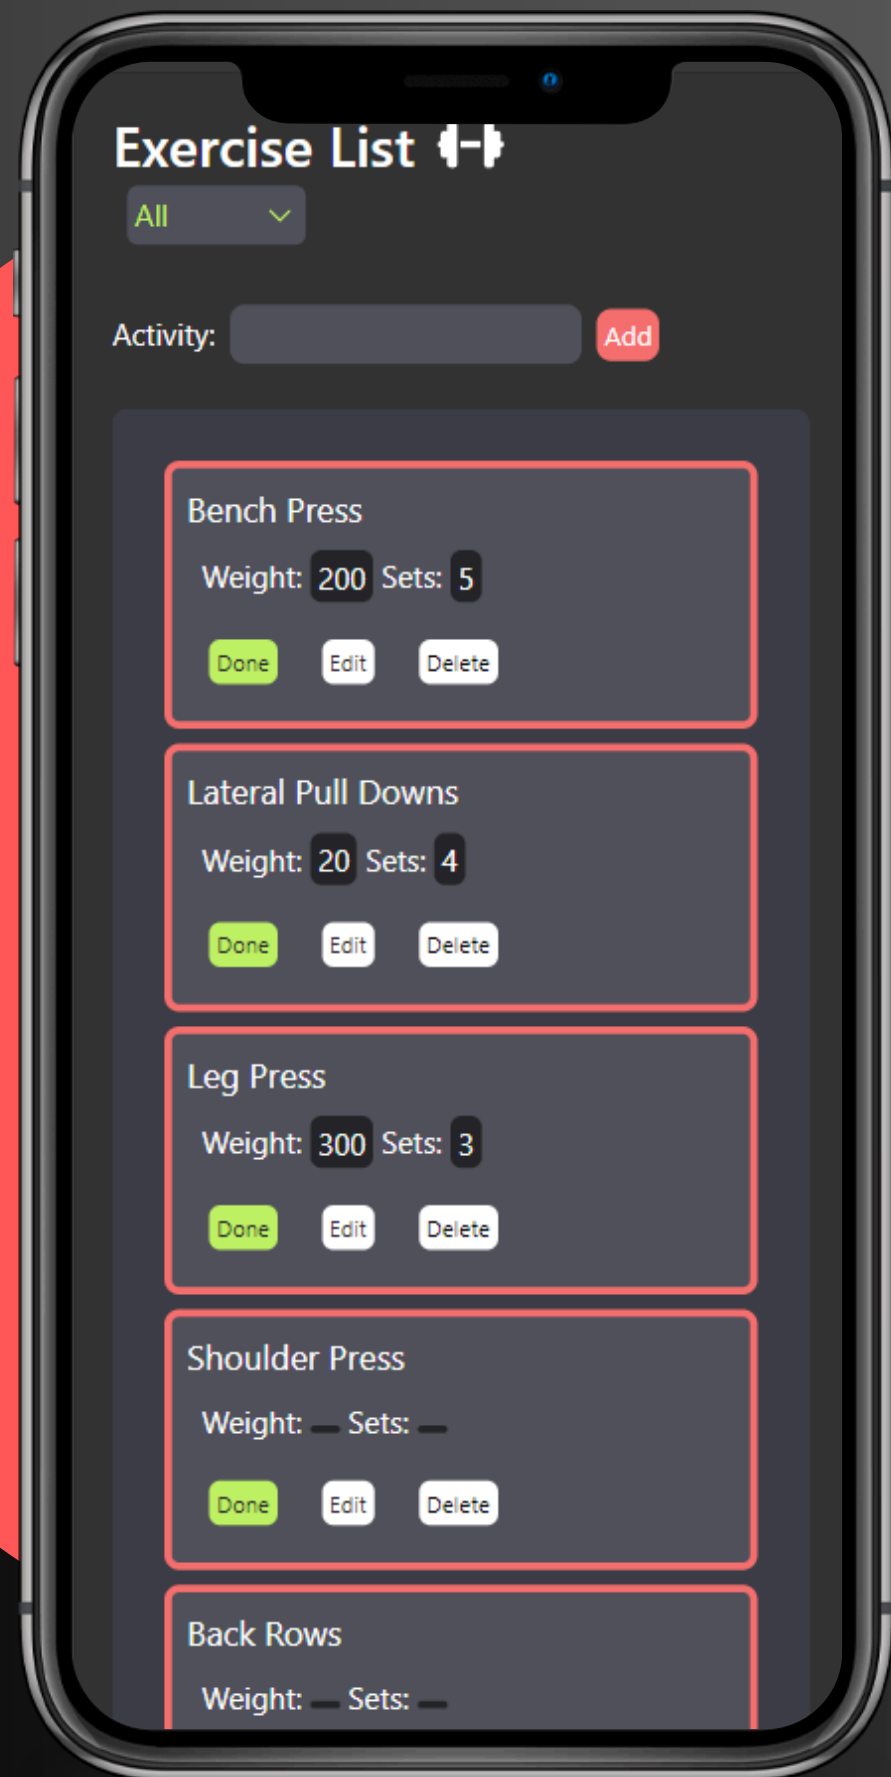

Back Rows
Weight: __ Sets: __

As a developer...

- Need a dropdown field for exercise categories
- The category state will need to 'live' on App.js since it will be used for TodoCreate and TodoList
- The dropdown will have an onChange event listener that will change the state of category
- A new value called category will be added to each Todo item
- TodoList will have a function that filters exercises according to category

- Need additional input form fields for exercise details
- Will need default ("") values when adding new Todo item
- These new inputs need to be editable in TodoEdit

- Show status of exercise (done/not done) using onSubmit event listener of Done button
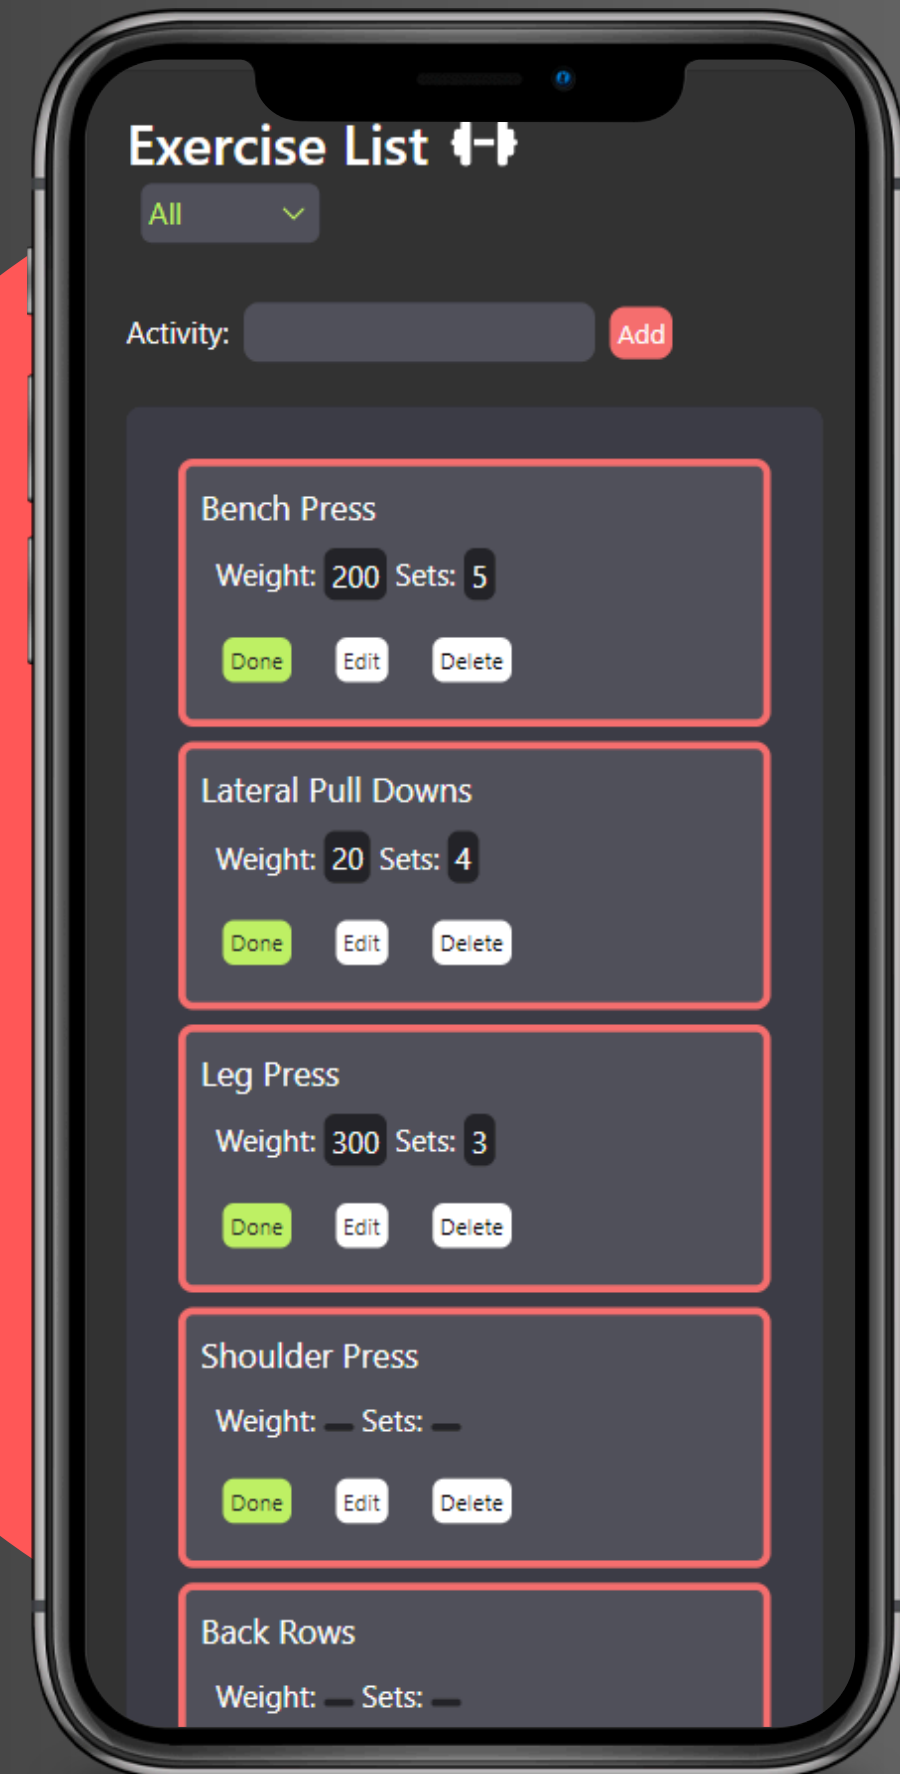

Critical Revisions

- The form inputs in TodoEdit will need distinct names to change the values of different attributes in a single onSubmit call

- Having the 'All' category to list all exercises will have problems when creating Todo items since it will not be under any specific category
